## RETROVIRAL PROTEASE INHIBITORS

### Background of the Invention

The present invention relates to retroviral protease  
10 inhibitor compounds, pharmaceutical compositions thereof, and  
a method of treating retroviral diseases therewith, including  
a method of treating disease states associated with human  
immunodeficiency virus (HIV-1, HIV-2).

Retroviruses, that is, viruses within the family of  
15 Retroviridae, are a class of viruses which transport their  
genetic material as ribonucleic acid rather than  
deoxyribonucleic acid. Also known as RNA-tumor viruses,  
their presence has been associated with a wide range of  
diseases in humans and animals. They are believed to be the  
20 causative agents in pathological states associated with  
infection by Rous sarcoma virus (RSV), murine leukemia virus  
(MLV), mouse mammary tumor virus (MMTV), feline leukemia  
virus (FeLV), bovine leukemia virus (BLV), Mason-Pfizer  
monkey virus (MPMV), simian sarcoma virus (SSV), simian  
25 acquired immunodeficiency syndrome (SAIDS), human T-  
lymphotropic virus (HTLV-I, -II) and human immunodeficiency  
virus (HIV-1, HIV-2), which is the etiologic agent of AIDS

- 2 -

(acquired immunodeficiency syndrome) and AIDS related complexes, and many others. Although the pathogens have, in many of these cases, been isolated, no effective method for treating this type of infection has been developed.

5       Retroviral replication occurs only in host cells. Critical to this replication is the production of functional viral proteins. Protein synthesis is accomplished by translation of the appropriate open reading frames into polyprotein constructs, which are processed, at least in  
10   part, by a viral protease into the functional proteins. The proteolytic activity provided by the viral protease in processing the polyproteins cannot be provided by the host and is essential to the life cycle of the retrovirus. In fact, it has been demonstrated that retroviruses which lack  
15   the protease or contain a mutated form of it, lack infectivity. See Katoh et al., *Virology*, 145, 280-92 (1985), Crawford, et al., *J. Virol.*, 53, 899-907 (1985) and Debouk, et al., *Proc. Natl. Acad. Sci. USA*, 84, 8903-6 (1987). Inhibition of retroviral protease, therefore, presents a  
20   method of therapy for retroviral disease.

The use of isosteric replacements has been disclosed as a strategy for the development of protease inhibitors for HIV-1. European Patent Applications EP-A 337 714, EP-A 357 332, EP-A 346 847, EP-A 342 541, EP-A 352 000, EP-A 393 445  
25   and EP-A 434 365 are representative, and are incorporated herein by reference. These references disclose dipeptide analogs of the natural polyprotein substrates of retroviral proteases. As discussed therein, these dipeptide analogs bind selectively and competitively to retroviral proteases;  
30   however, the protease is unable to cleave the carbon-carbon bond presented to it instead of the scissile amide bond of the natural substrate. Thus, such compounds are useful for inhibiting viral replication by inactivation of the protease. The incorporation of heterocyclic elements in the P3' and P4'  
35   substrate positions of compounds containing a dipeptide isostere has been disclosed by deSolms et al., *J. Med. Chem.*, 34, 2852 (1991). However, these compounds can be less than desirable for obtaining optimal drug delivery in mammalian

- 3 -

organisms, particularly in humans. Some of these compounds can also have a less than desirable serum half-life, and therefore duration of action, because they contain amide bonds in relatively high proportion, and thus are prone to metabolic degradation, hepatic clearance, or other elimination mechanisms.

There exists a need for novel compounds which inhibit retroviral protease activity, and a need for compounds which possess desirable pharmacokinetic properties for good drug delivery and metabolic stability for good serum half-life and duration of action. Such pharmaceutical uses provide therapies for retroviral diseases in mammals, especially in humans, which have been heretofore difficult to treat.

#### 15                    SUMMARY OF THE INVENTION

The present invention provides compounds, hereinafter represented as formula (I), which bind to retroviral proteases. These compounds are inhibitors of retroviral proteases and are useful for treating diseases related to infection by retroviruses.

The present invention also provides a pharmaceutical composition comprising a compound of formula (I) and a pharmaceutically acceptable carrier.

25            The present invention additionally provides a method for treating retroviral disease, comprising administering to a mammal in need thereof an effective amount of a compound of formula (I).

and,

- 2) if appropriate, a coupling agent; and
- 3) removing any protecting groups and
- 15 4) forming a pharmaceutically acceptable salt thereof.

The coupling reactions may be accomplished by activating the substrate with a reactive functional group *in situ* or prior to the coupling reaction, such that it is reactive with an amino group. For instance, acids may be converted to acid  
 20 chlorides, bromides, activated esters or anhydrides, or by adding a coupling reagent. Coupling agents are well known in the art for activating a functional group *in situ*. Exemplary of such agents are DCC and other carbodiimides, DMAPEC, BOP and PPA. These coupling agents may optionally be  
 25 used with other reagents, such as HOBT, NMM and DMAP, which may facilitate the reaction.

Suitable leaving groups, L', are those which are displaceable by an amino group, such as bromo, chloro, a substituted acyl (eg. trifluoroacetyl, bromobenzoyl,  
 30 nitrobenzoyl) or a substituted phenol (eg. 4-nitrophenol) and the like. If L' is OH, so that A-OH is an acid, it will be appropriate to use a coupling agent as hereinbefore described.

For instance:

- 19 -

The amino aldehydes are generally known or are prepared by methods well known in the art, for instance, by reduction of a suitable  $\alpha$ -amino acid ester with diisobutylaluminum hydride. Further reaction of the aldehyde with a gem  
5 dialdehyde, or diketone, and ammonia yields the desired imidazole. Alkylation and further modification of the substituent groups of the imidazole are within the skill of the art. Such a method and other methods for preparing imidazoles are disclosed, for instance, by Baldwin et al., *J.*  
10 *Med. Chem.*, 29, 1065 (1986), *Angew. Chem. Int.*, 22, 560 (1983), and Hughey et al., *Synthesis*, 489 (1980). Alternately, acyl imidazoles may be prepared by coupling an  $\alpha$ -amino acid to a substituted 4-amino-isoxazole, and subsequent reduction and base catalyzed rearrangement as  
15 disclosed generally by Reiter, L.A., *J. Org. Chem.*, 52, 2714 (1987). Intermediate compounds of formula (VIII) are a part of this invention. Preferably,  $R^{7'}$  is  $C_{1-6}$ alkyl and more preferably  $C_{3-6}$ alkyl. Suitably,  $R^{8'}$  and  $R^{9'}$  are H,  $NO_2$ , Br,  $COR^{12}$ ,  $CF_3$ , Ar,  $C_{1-6}$ alkyl or  $C_{1-6}$ alkyl- $R^{15}$ , wherein  $R^{12}$  is H,

5  
Suitable protecting groups for the amino, hydroxyl, carboxylic acid, mercaptan group, and reagents for deprotecting these functional groups are disclosed in Greene et al., PROTECTIVE GROUPS IN ORGANIC SYNTHESIS, Second  
10 Edition, John Wiley and Sons, New York, 1991. Deprotection indicates the removal of the protecting group and replacement with an hydrogen atom. In particular, suitably substituted acetyl, benzyl and silyl groups are useful for protecting the hydroxyl group. The acetyl group is commonly removed by  
15 reacting the compound with a base, such as an alkali metal hydroxide, in a mixture of an alcohol and water. The silyl group, such as trimethyl silyl, dimethyl-t-butyl silyl, and t-butyl-diphenyl silyl may be removed by a fluoride reagent, such as a tetra-alkyl ammonium fluoride, or by acid  
20 hydrolysis. The benzyl group may be removed by catalytic hydrogenation.

Suitable protecting groups for the amino group are those disclosed by Greene et al., as indicated previously. The benzyloxycarbonyl and t-butoxycarbonyl groups are especially  
25 useful amino protecting groups.

The present invention includes pharmaceutically acceptable acid addition salts. Acid addition salts of the present compounds are prepared in a standard manner in a suitable solvent from the parent compound and an excess of an  
30 acid, such as hydrochloric, hydrobromic, sulfuric, phosphoric, acetic, maleic, succinic or methanesulfonic. The acetate salt form is especially useful. If the final compound contains an acidic group, cationic salts may be prepared. Typically the parent compound is treated with an  
35 excess of an alkaline reagent, such as a hydroxide, carbonate or alkoxide, containing the appropriate cation. Cations such

- 25 -

as  $\text{Na}^+$ ,  $\text{K}^+$ ,  $\text{Ca}^{++}$  and  $\text{NH}_4^+$  are examples of cations present in pharmaceutically acceptable salts. Certain of the compounds form inner salts or zwitterions which may also be acceptable.

The compounds of the present invention selectively bind  
5 to retroviral proteases in the same manner as the virally coded natural substrates of the proteases and compete with these substrates for protease, thereby serving to inhibit viral replication by blocking the formation of crucial viral proteins from polyprotein precursors by the protease, and  
10 hence, to inhibit disease progression *in vivo*. The present compounds achieve such beneficial therapeutic effect because they contain unique structural features which impart desirable pharmacokinetic properties to the compounds. One such property is long duration of action. We have found that  
15 substitution of a heterocycle, especially imidazole, in the putative P2' position of the present compounds affords compounds which retain good enzyme binding affinity, good antiviral activity, a favorable duration of action and water solubility for good drug delivery.

20 When a compound of the present invention is administered to an animal infected or potentially infected with a retrovirus, viral replication is inhibited and hence disease progression is retarded. Inasmuch as the amino acid sequences of the protease binding and peptide bond cleavage  
25 sites of various retroviruses appear to be highly conserved, an inhibitor is likely to be broadly active against more than one retrovirus. Also, DNA viruses which are dependant upon virally encoded proteases, such as the hepatitis virus, may also be susceptible to such treatment.

30 The compounds of formula (I) are used to inhibit retroviral replication, and are useful in treating mammals, particularly human patients, who are infected with susceptible retroviruses and require such treatment. The method of treating a retroviral disease in a mammal,  
35 particularly a human, comprises internally administering (e.g. orally, parenterally, buccally, trans-dermally, rectally or by insufflation) to said mammal an effective amount of a compound of formula (I), preferably dispersed in

- 26 -

a pharmaceutical carrier. Dosage units of the active ingredient may be selected by procedures routine to one skilled in the art, and are generally in the range of 0.01-50 mg/kg. These dosage units may be administered one to ten  
5 times daily for acute or chronic infection. Preferably the compound is administered at a level of 1-10 mg/kg, two to four times daily. No unacceptable toxicological effects are indicated when compounds of this invention are administered in the above noted dosage range.

10 The present invention also provides a method of treating disease states associated with HIV infection or Acquired Immune Deficiency Syndrome (AIDS), comprising administering an effective amount of a compound of formula (I), preferably dispersed in a pharmaceutical carrier.

15 Beneficial effects may be realized by co-administering, individually or in combination, other anti-viral agents with the protease inhibiting compounds of the present invention. Examples of anti-viral agents include nucleoside analogues, phosphonoformate, rifabutin, ribavirin, phosphonothioate  
20 oligodeoxynucleotides, castanospermine, dextran sulfate, alpha interferon and amplitagen. Nucleoside analogues, which include 2',3'-dideoxycytidine(ddC), 2',3'-dideoxyadenine(ddA) and 3'-azido-2',3'-dideoxythymide (AZT), are especially useful. AZT is a preferred agent. Suitably, pharmaceutical  
25 compositions comprise an anti-viral agent, a protease inhibiting compound of the present invention, and a pharmaceutically acceptable carrier.

This invention is also a pharmaceutical formulation which comprises a compound of formula (I) and a  
30 pharmaceutically acceptable carrier. Pharmaceutical acceptable carrier are well known in the art and are disclosed, for instance, in SPROWL'S AMERICAN PHARMACY, Dittert, L. (ed.), J.B. Lippincott Co., Philadelphia, 1974, and REMINGTON'S PHARMACEUTICAL SCIENCES, Gennaro, A. (ed.),  
35 Mack Publishing Co., Easton, Pennsylvania, 1985.

Pharmaceutical compositions of the compounds of the present invention, or derivatives thereof, may be formulated as solutions or lyophilized powders for parenteral

- 27 -

administration. Powders may be reconstituted by addition of a suitable diluent or other pharmaceutically acceptable carrier prior to use. The liquid formulation is generally a buffered, isotonic, aqueous solution. Examples of suitable  
5 diluents are normal isotonic saline solution, standard 5% dextrose in water or buffered sodium or ammonium acetate solution. Such formulation is especially suitable for parenteral administration, but may also be used for oral  
10 administration or contained in a metered dose inhaler or nebulizer for insufflation. It may be desirable to add excipients such as ethanol, polyvinylpyrrolidone, gelatin, hydroxy cellulose, acacia, polyethylene glycol, mannitol, sodium chloride or sodium citrate.

Alternately, these compounds may be encapsulated,  
15 tableted or prepared in a emulsion or syrup for oral administration. Pharmaceutically acceptable solid or liquid carriers may be added to enhance or stabilize the composition, or to facilitate preparation of the composition. Liquid carriers include syrup, soy bean oil, peanut oil,  
20 olive oil, glycerin, saline, ethanol, and water. Solubilizing agents, such as dimethylsulfoxide, ethanol or formamide, may also be added. Carriers, such as oils, optionally with solubilizing excipients, are especially suitable. Oils include any natural or synthetic non-ionic  
25 water-immiscible liquid, or low melting solid, which is capable of dissolving lipophilic compounds. Natural oils, such as triglycerides are representative. In fact, another aspect of this invention is a pharmaceutical composition comprising a compound of formula (I) and an oil.

30 Solid carriers include starch, lactose, calcium sulfate dihydrate, terra alba, magnesium stearate or stearic acid, talc, pectin, acacia, agar or gelatin. Solubilizing agents, such as dimethylsulfoxide or formamide, may also be added. The carrier may also include a sustained release material  
35 such as glyceryl monostearate or glyceryl distearate, alone or with a wax. The amount of solid carrier varies but, preferably, will be between about 20 mg to about 1 g per dosage unit. The pharmaceutical preparations are made

- 28 -

following the conventional techniques of pharmacy involving milling, mixing, granulating, and compressing, when necessary, for tablet forms; or milling, mixing and filling for hard gelatin capsule forms. When a liquid carrier is used, the preparation will be in the form of a syrup, elixir, emulsion or an aqueous or non-aqueous suspension. Such a liquid formulation may be administered directly p.o. or filled into a soft gelatin capsule.

A suitable dosage form for oral administration has been prepared by dissolving the peptide of Example 1 (312.5 mg) in dimethyl sulfoxide (1 mL) and diluting to a concentration of 12.5 mg/mL with soybean oil. A suitable dosage form for intravenous administration has been prepared by dissolving the compound of Example 1 (0.02 g) in dimethyl sulfoxide (1 mL) and diluting to 20 mL with a 70% propylene glycol/30% ethanol solution.

For rectal administration, a pulverized powder of the compounds of this invention may be combined with excipients such as cocoa butter, glycerin, gelatin or polyethylene glycols and molded into a suppository. The pulverized powders may also be compounded with an oily preparation, gel, cream or emulsion, buffered or unbuffered, and administered through a transdermal patch.

The pharmacological activity of the compounds of this invention may be demonstrated by enzyme assays to determine the inhibitory activity of the retroviral protease, by *in vitro* cellular-based assays to determine the ability of the compounds to penetrate cells and inhibit viral replication, and by pharmacokinetic assays to determine oral bioavailability, drug half-life and clearance. These assays are well known in the art.

#### ENZYME ACTIVITY

The ability of the compounds of this invention to inhibit the HIV-1 protease enzyme may be demonstrated by using the assay disclosed by Dreyer et al., *Proc. Natl. Acad. Sci., U.S.A.*, 86, 9752 (1989), Grant et al., *Biochemistry*, 30 8441 (1992), and EP-A 352 000. The  $K_i$  for the compounds of

- 29 -

this invention are in the range of 1 nM to 5  $\mu$ M. Preferred compounds have  $K_i$ 's of less than 100 nM.

#### INFECTIVITY

5       The ability of the compounds of this invention to gain entry to cells infected with the human immunodeficiency virus, and to inhibit viral replication *in vitro* may be demonstrated using the assay described by Meek et al., *Nature*, 343, 90 (1990), and Petteway et al., *Trends*  
10 *Pharmacol. Sci*, 12, 28 (1991). The  $IC_{50}$  for the compounds of this invention are in the range of 0.1 to 10  $\mu$ M.

#### CYTOTOXICITY

      Cytoitoxicity is assessed by both direct microscopic  
15 examination of trypan blue stained cells (T-lymphocytes) and by the treated culture's ability to metabolize the tetrazolium salt XTT (2,3-bis[2-methoxy-4-nitro-5-sulfophenyl]-2H-tetrazolium-5-carboxanilide sodium salt), to its formazan dye. The XTT assay allows determination of the  
20 50% toxic concentration of compounds for the cell/virus system used.

#### PHARMACOKINETICS

      Dual jugular cannulated Sprague Dawley rats weighing 200  
25 to 250 g were utilized in all studies. All dosing and sample collection was done from conscious rats. Before dosing, a time 0 blood sample, 300  $\mu$ L, was drawn using one of the catheters. Utilizing the second catheter the rats were dosed intravenously. At 1, 10, 30, 60, 90, 120, 150, 180 and 210  
30 min after dosing, 300  $\mu$ L blood samples were drawn. The rats dosed orally were administered the compound by utilizing a 22 gauge gastric gavage needle and samples were drawn at 30, 60, 90, 120, 240, 360, 480, 600, 720 and 1440 min. The blood samples were placed in precooled tubes containing 30 mL of  
35 sodium citrate and centrifuged in a microfuge. The plasma was transferred then snap frozen on dry ice, and stored at -70°C until analyzed.

- 30 -

Standard stock solutions (1 mg/mL) of inhibitor was prepared in 100% DMSO. A dilution series of the stock solutions were prepared in a total volume of 0.1 mL (pooled normal rat plasma/DMSO) to yield final concentrations of 0 and 0.5-120X the  $K_i$  of the inhibitor. All dilutions were performed in triplicate. These spiked plasma solutions were extracted with 0.5 mL acetonitrile by vigorous vortexing, followed by centrifugation for 10 min. An aliquot (0.4 mL) of the supernatant was removed and dried in Eppendorf tubes using a Speed-vac. The resulting residue was redissolved in DMSO. The inhibition of the HIV-1 protease activity was assayed as follows. An aliquot of the extracted sample was added to a 50  $\mu$ L mixture containing 1X MENDT buffer, 1 mM substrate and incubated at 37°C < 10 min. The reaction was then initiated by the addition of HIV-1 protease and continued at 37°C for an additional 15 min, then quenched by the addition of TFA (0.5% final concentration). Initial rates were determined for each standard curve as the fraction of remaining enzymatic activity ( $v_i/v_0$ ) at each inhibitor concentration, in which  $v_0$  is the velocity of the I (inhibitor concentration)=0 sample. Assuming that all of the original inhibitor in the spiked samples was extracted, the values of  $v_i/v_0$  were plotted versus inhibitor concentration of the original extracted sample and fitted to the equation:

$$v_i/v_0 = [AE_t - I_t - K_i + (K_i - AE_t - I_t)^{0.5}] / (2AE_t)$$

in which  $E_t$  is the total enzyme concentration at time zero,  $K_i$  is the apparent inhibition constant and A is the fraction of active enzyme.

Ex vivo animal plasma samples containing unknown levels of protease inhibitor were prepared and analyzed as described for the standard curve described above. The concentration of inhibitor in these samples was then determined using the  $K_i$  and A parameters from the fitted standard curve according to the following equation:  $I_t = AE_t[1 - (v_i/v_0)] + K_i(v_0/v_i)$ .

The data was plotted as the natural log (ln) of the plasma concentration versus time on semilogarithmic paper to generate the plasma concentration-vs-time curves. Using the IV data, the apparent terminal rate constant was determined

- 31 -

form the linear regression analysis of the plasma concentration-vs-time curve. The elimination half-life ( $t_{1/2}$ ) was derived by dividing  $\ln 0.5$  ( $=0.693$ ) by the terminal rate constant. The area under the plasma concentration-vs-time curve (AUC) was determined by using the ln/log trapezoidal rule.  $C_{max}$  represents the maximal plasma concentration and  $t_{max}$ , the time following drug administration at which  $C_{max}$  was observed. Both values were estimated by inspection of the plasma concentration-vs-time curve. Total plasma clearance (CL) was calculated by dividing the dose by the AUC. The fraction of the oral dose available to the systemic circulation (the bioavailable fraction, F) was determined by the equation:  $F = [AUC_{po}/DOSE_{po}] \times [DOSE_{iv}/AUC_{iv}]$ .

a)  $\alpha$ -(t-butoxycarbonyl)-amino- $\alpha$ -cyclopropylacetonitrile

- 103 -

To a solution of cyclopropylmethanol (10.2 g, 141 mmol) in methylene chloride (250 mL) sodium acetate (1 g) and 20 g of Celite® were added. Pyridinium chlorochromate (30 g, 140 mmol) was added in small portions over a period of 30 m.

- 5 After 1 h the reaction mixture was diluted with ether (100mL), filtered through Celite® and washed with ether. The combined organic extracts (1 L) were concentrated *in vacuo* at 15-18°C to yield formyl cyclopropane.

- The crude aldehyde was dissolved in water (50 mL), and  
10 ammonium chloride (6.51 g), potassium cyanide (7.16 g) and aqueous ammonium hydroxide (100 mL, 28% w/w). The reaction mixture was stirred at room temperature overnight, extracted with ethyl acetate, and the combined organic extracts were dried over MgSO<sub>4</sub>. Filtration and evaporation of the solvent  
15 *in vacuo* yielded  $\alpha$ -amino- $\alpha$ -cyclopropyl acetonitrile as an oil.

- To a solution of the crude aminonitrile (2 g) in THF (20 mL) di-tert-butylidicarbonate (1.53 g, 7 mmol) was added. The reaction was stirred overnight. Removal of the solvent *in*  
20 *vacuo* followed by flash chromatography (silica, 1:8 ethyl acetate:hexane) yielded the title compound (2.8 g). <sup>1</sup>H NMR(CDCl<sub>3</sub>, 200 MHz)  $\delta$  5.0 (bs, 1H), 4.4 (bs, 1H), 1.4 (s, 9H), 1.2 (m, 1H), 0.7 (m, 2H), 0.5 (m, 2H).
